My Reflection:

       Throughout this project I had a really good time working with my partner and implementing the knowledge we have learned throughout the first quarter. Our planning process was very effective, on how we both spent a day and came with ideas to implement. I came up with a pirate going down an ocean trench and getting the treasure, and also the idea we ended up using an athlete shooting a three pointer. On the other hand Rohan came up with an idea of a golf course. After discussing pros and cons of each idea, we proceeded to the next steps. For our program we stumbled upon a couple errors, and had to refer back to our previous work to debug, and try several new ways to make something work. I contributed a lot for this project, as I made the maps, the structure of the classes, made the UML diagram, and also helped write the code of the methods. I feel like I worked really well with Rohan as he was a great partner and we were able to accomplish what we wanted. This concept taught me a lot more on how abstract classes work, because we were the ones that made them, and used the abstract methods. A lot of theory and vocabulary was clarified as well. This was a really great experience as a project.
